Set up a time-controlled geofence

This guide explains how to set up a time controlled geofence in the Stella Care Administration System. A time controlled geofence is active only on specific days and during certain hours, for example at night or within a defined time range, and helps tailor monitoring to the citizen's needs.

How to set up a time controlled geofence:

1. Go to the **Citizens** menu in the left side of the Administration System.
2. Find the citizen you want to set up a time controlled geofence for and click their name.
3. Click the **edit icon** () to open the citizen's settings.
4. Go to the **Geofence** tab.
5. Make sure the desired geofence is already active for the citizen. It must appear in the left column.
6. Find the geofence you want to schedule and click the **clock icon** next to it.
7. A window opens where you can set:
    1. The days when the geofence should be active
    2. The time range during which the geofence should be active (for example 22:00–06:00)
8. Click **Save** to activate the schedule.

Tips:

- You can change the time settings at any time by clicking the clock icon again.
- If the geofence does not appear, activate it for the citizen first by dragging it from the right column to the left column.
